Zaman Gabdrakhmanov

Backend Developer

Go and Python backend developer. Build services end to end, from database design and testing to production deployment and operations.

WORK EXPERIENCE

VK tech – R&D AI Product Lab — September 2025 – Present

Go/Python Developer

About the Team

Validate product hypotheses with a focus group, turn successful prototypes into production services, and integrate them into VK tech products.

Tech Stack

Go, Python, PostgreSQL, Qdrant, Kafka, Kubernetes, Helm, MCP, Prometheus, Grafana, Linux

Responsibilities

- Development of a high-throughput message indexing service, an AI agent, and MCP integrations
- Production operations for the team's services and integration of the AI assistant and MCP into on-premises releases

Achievements

- Designed and launched a production message indexing service for semantic search (PostgreSQL → Qdrant). Sustained approximately 3,000 messages/sec during reindexing; the source database contains over 1 billion messages and occupies 435 GB on disk.
- Learned the deployment workflow for VK's production infrastructure and trained teammates to deploy services independently.
- Migrated the live AI assistant from its MVP implementation to a new architecture.
- Took ownership of AI assistant integration into on-premises releases 26.3 and 26.4.
- Organized candidate sourcing, designed the interview format, and conducted interviews alongside team leaders, hiring two interns. Mentored one of them in implementing AI agent evaluation on real user queries.
- Designed the challenge and implemented the automated evaluation platform for IT Academy Hack 2026; prepared a sample solution and edited the challenge write-up on Habr.

VK tech – Pilot Projects Team — August 2024 – September 2025

Go Developer

About the Team

Development and testing of pilot solutions based on the Tarantool DBMS for enterprise clients.

Tech Stack

Go, Tarantool, Ansible, etcd, Prometheus, Docker, Grafana, K6, Linux

Responsibilities

- Design and development of pilot solutions, load testing
- Query optimization and improving data access patterns
- Client communication and presentation of results
- CLI development in Go:
  - A tool for deploying Tarantool with preconfigured scenarios (topology, tables, load tests, Grafana)
  - A data generator with support for domain dictionaries, relationships, and multiple output formats (CSV, Parquet, HTTP, Tarantool)

Achievements

- High score in performance review
- Released the data generator as open source – SDVG
- Improved Parquet write performance by 25%
- Developed a distributed load testing tool with ETCD synchronization
- Discovered latency dependency on DBMS and CPU configuration in a pilot for a major bank
- Completed 3 pilots

ACHIEVEMENTS

- **3rd place**, Moscow Tourist Hackathon *(GitHub)* *March 30 – April 7, 2024*
  Participated in redesigning the routes section of RUSSPASS with a focus on UX/UI and developed a concept for tourist point check-in using NFC tags
- **2nd place**, IT Purple Hack *(GitHub)* *March 9 – 15, 2024*
  Optimized price search by category and region and designed a geo-distributed system for parallel price matrix updates nationwide
- **2nd place**, LCT Hackathon Yakutia *(GitHub)* *December 9 – 23, 2023*
  Developed VK data collection via API and proposed incorporating personality traits (Big Five model) into a career guidance ML model based on social media profiles

EDUCATION

NUST MISIS, Institute of Computer Science
Applied Mathematics, bachelor's program

- Martin Kleppmann's book – Designing Data-Intensive Applications

SKILLS

Programming Languages: Golang, Python
Frameworks: Gin, FastAPI
Databases: PostgreSQL, Tarantool, Redis
Skills: Kubernetes, K6, Ansible, Kafka, Prometheus, Jaeger, Docker, Docker-compose, RabbitMQ, OpenTelemetry, Make, Linux, Git, Goose, Alembic, Swagger, Selenium, SQLAlchemy, GitHub Actions, pprof
English: B2
